

ECOBLOOM

How can we grow smarter?

ECOSENSE BY ECOBLOOM

Ecobloom's R&D facility

Monitor your farm
through the push of a button 📱

How it works

Camera node

- Growth & maturity
- Health & stress

Air node

- Temp.
- Humidity
- PAR
- VPD

Water node

- Temp.
- pH
- EC
- TDS

EcoSense multispectral imaging technology

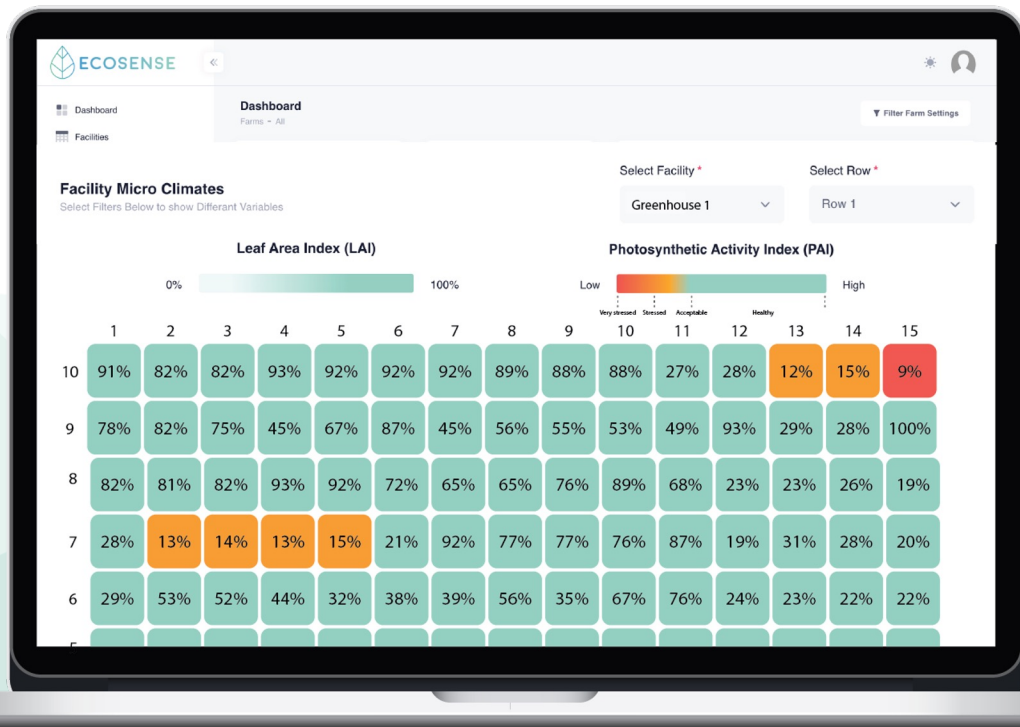

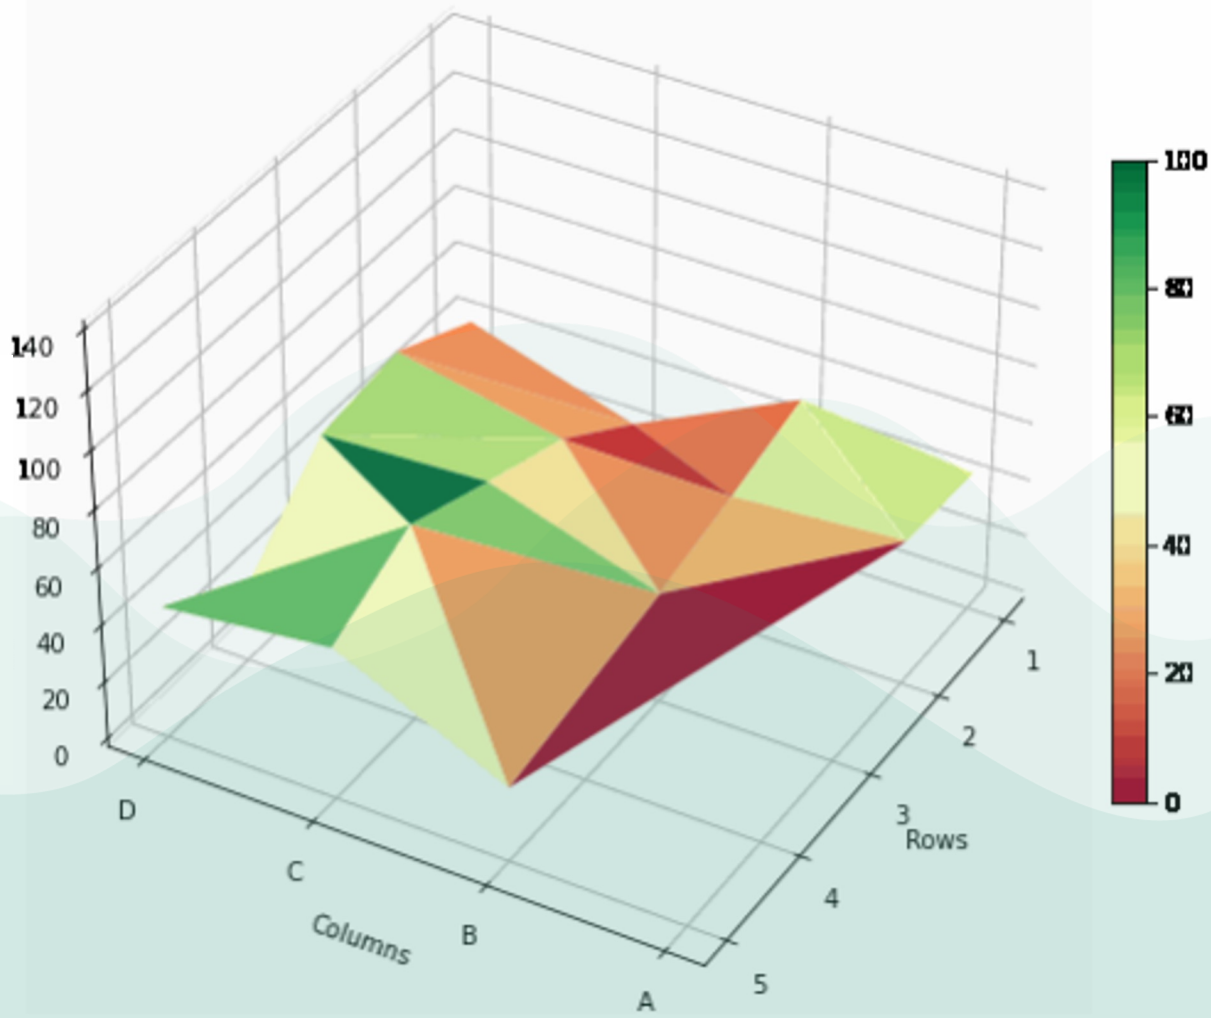

- 📷 Multispectral image analysis
 - Disease identification
 - Stress level detection
 - Growth rate
 - Photoperiod optimization
 - Maturity analysis
 - Harvest predictions
 - Algae growth warning system
 - Real time Photosynthetic activity tracking

Full control and insight into the growth process

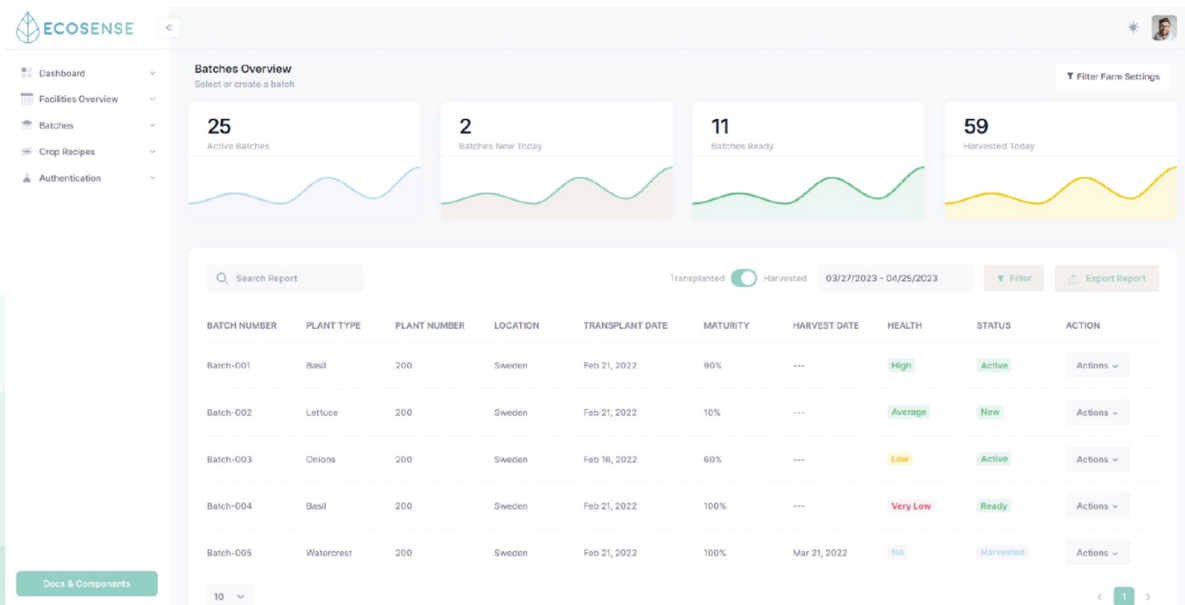

Monitor and control each batch

Batch Tracking

- Comprehensive Oversight
- Data-Driven Decisions
- Traceability
- Efficiency
- Learning and Improvement

- Dashboard
- Facilities Overview
- Batches
- Crop Recipes
- Authentication

Benefits and Values

Implementation

- All types of indoor farms
- Plant agnostic

**Increase yield and
reduce waste**

**Reduce energy
consumption**

**Improve crop health
& quality**

**No manual
documentation**

The potential of HPC in CEA

Complex Ecosystem Simulation:

HPC can simulate entire controlled agricultural ecosystems in real-time, accounting for countless variables (like micro-climate conditions, plant interactions, soil composition) at a scale and complexity that is unmanageable for standard computing systems. This provides insights into optimal growing conditions and environmental impacts

Long-Term Environmental Impact Analysis:

HPC can be utilized to conduct long-term environmental impact studies of CEA practices. This involves processing extensive data sets over long periods to simulate and predict the impact of CEA on resources like water, energy, and land use. Such comprehensive environmental modeling demands the high-level data processing abilities of HPC, especially when considering multiple variables and their interactions over extended timeframes.

Real-Time Integrated System Management:

HPC can manage and optimize the integrated systems within a CEA setup in real-time. This includes controlling automated systems for planting, watering, lighting, and harvesting based on continuous data input. The complexity and need for real-time processing and response in such an integrated system require the robust computational power of HPC, which goes beyond the capabilities of regular cloud computing or local servers.

Enabling scalability - what we are looking for

- Research partnerships
- Funding / grants for R&D
- Investments

Thank you!
